

EXPERIMENT 8: Simple Stochastic POS Tagging

Aim: To implement a simple probabilistic Part-of-Speech tagging algorithm.

Program:

```
sentence = input("Enter a sentence: ")
words = sentence.split()
for word in words:
    if word.endswith("ing"):
        print(word, ": Verb")
    elif word[0].isupper():
        print(word, ": Noun")
    else:
        print(word, ": Other")
```

Output:

The screenshot displays a Python IDE with two windows. The left window, titled 'EXP8.py', contains the following code:

```
sentence = input("Enter a sentence: ")
words = sentence.split()
for word in words:
    if word.endswith("ing"):
        print(word, ": Verb")
    elif word[0].isupper():
        print(word, ": Noun")
    else:
        print(word, ": Other")
```

The right window, titled 'IDLE Shell 3.14.0', shows the execution output:

```
>>>
= RESTART: C:/Users/Sravanthi.gunapu/OneDrive/ドキュメント/NLP/LAB EXPERIMENTS/EXP8.py
Enter a sentence: Birds fly high
Birds : Noun
fly : Other
high : Other
>>>
```

The Windows taskbar at the bottom shows the system clock as 20:36 on 05-08-2026, with a temperature of 31°C and 73% battery level.
