

EXPERIMENT 24. Dialog Act Recognition

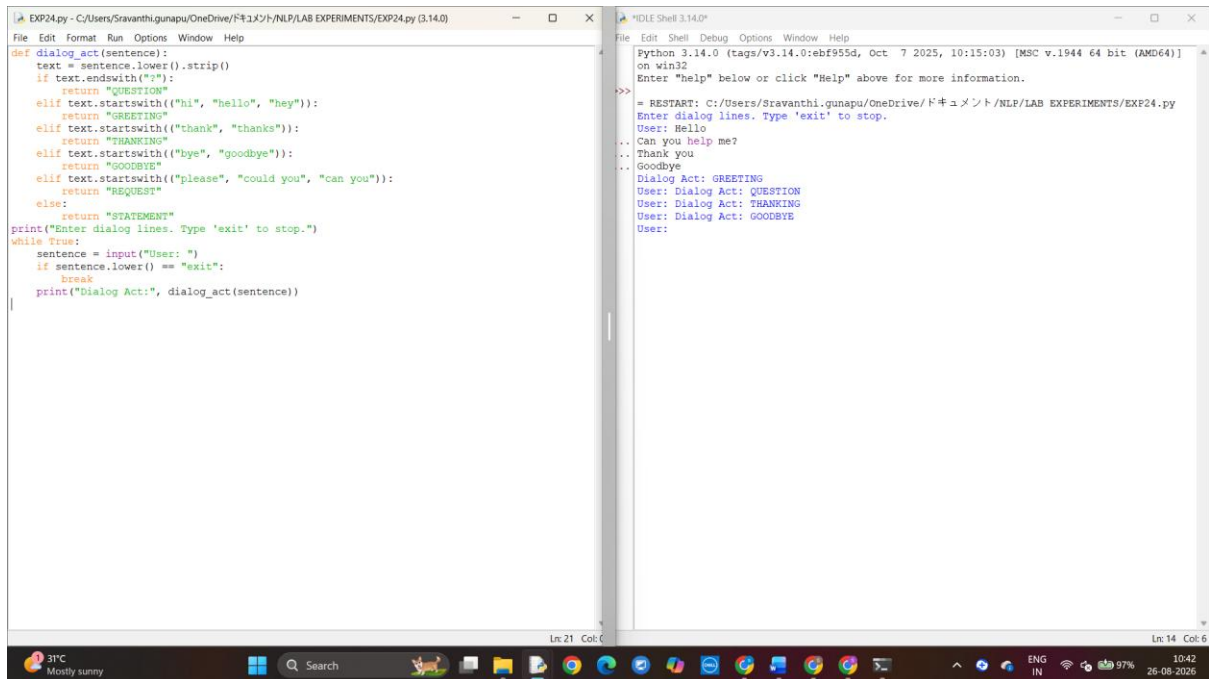

Aim: To create a Python program that recognizes dialog acts in a conversation.

Program:

```
def dialog_act(sentence):
    text = sentence.lower().strip()
    if text.endswith("?"):
        return "QUESTION"
    elif text.startswith(("hi", "hello", "hey")):
        return "GREETING"
    elif text.startswith(("thank", "thanks")):
        return "THANKING"
    elif text.startswith(("bye", "goodbye")):
        return "GOODBYE"
    elif text.startswith(("please", "could you", "can you")):
        return "REQUEST"
    else:
        return "STATEMENT"

print("Enter dialog lines. Type 'exit' to stop.")
while True:
    sentence = input("User: ")
    if sentence.lower() == "exit":
        break
    print("Dialog Act:", dialog_act(sentence))
```

Output:

The image shows a screenshot of a Windows desktop with two windows open. The left window is a text editor titled 'EXP24.py - C:/Users/Sravanthi.gunapu/OneDrive/ドキュメント/NLP/LAB EXPERIMENTS/EXP24.py (3.14.0)'. It contains a Python script for a simple chatbot. The right window is a terminal titled 'Python Shell 3.14.0*', showing the execution of the script. The terminal output shows the chatbot's responses to various user inputs.

```
def dialog_act(sentence):
    text = sentence.lower().strip()
    if text.endswith("?"):
        return "QUESTION"
    elif text.startswith(("hi", "hello", "hey")):
        return "GREETING"
    elif text.startswith(("thank", "thanks")):
        return "THANKING"
    elif text.startswith(("bye", "goodbye")):
        return "GOODBYE"
    elif text.startswith(("please", "could you", "can you")):
        return "REQUEST"
    else:
        return "STATEMENT"
print("Enter dialog lines. Type 'exit' to stop.")
while True:
    sentence = input("User: ")
    if sentence.lower() == "exit":
        break
    print("Dialog Act:", dialog_act(sentence))
```

```
